

Iteration 2, packed pairs and fused layers: each pass reads and writes all 128 words once

the 128 words of the 24×128 macro, 16 per row; blue: the words of one group, transformed together in a register bank; iteration 3 fuses 3 + 4 layers in two passes

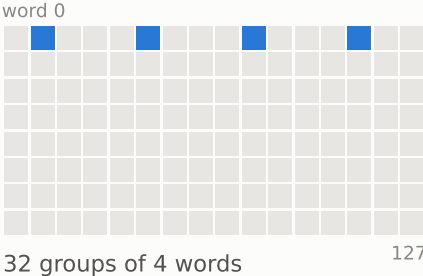

(a) one word holds a pair of coefficients

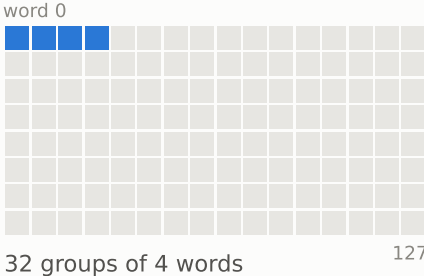

(b) pass 1: len = 128, 64, 32

(c) pass 2: len = 16, 8

(d) pass 3: len = 4, 2

24-bit word = two 12-bit coefficients; $\text{len} \geq 2$, so the two halves never meet
